can you provide me with studies and conclusions for if the inner monologue exists in all people?

The question of whether all people have an inner monologue is a fascinating and complex area of psychological study. The research in this field suggests a rich diversity in the way people think and process information internally.

According to psychologist Russell Hurlburt, about 30 to 50 percent of people regularly engage in internal monologues, where they think to themselves in unspoken words. This inner or "private" speech is not only common but also plays a crucial role in the development of language skills and in the processing of information and memory. Most people likely engaged in this form of speech as young children while developing their language skills, and later as a means of rehearsing information to improve memory retention 13<sup>+</sup>source .

However, not everyone experiences an inner monologue in the same way. Some individuals may process information and prepare for tasks using visual imagery rather than words. For example, instead of thinking about or hearing the words for items on a to-do list, they might visualize the list or see images related to the tasks. This suggests that the inner experience of these individuals is more visually oriented, as opposed to being dominated by verbal thoughts 14<sup>+</sup>source .

Overall, the study of inner monologues is still evolving, and psychologists are continuing to explore this internal voice. It's a complex subject, as the existence and nature of the inner monologue can vary greatly from person to person 28<sup>+</sup>source .

These studies highlight the diversity in cognitive processing among individuals, indicating that the presence and nature of an inner monologue can differ widely, reflecting the varied ways in which people think and experience the world.

Do some people not have an inner experience at all?

children:

The concept of not having any inner experience at all is quite intriguing. Generally, it's not that some people lack an inner experience entirely, but rather, their inner experiences may manifest differently. While many people have an inner monologue or think in words, others might have inner experiences that are more visual or abstract, involving images or sensory experiences rather than verbal thoughts.

The idea of an entirely absent inner experience is challenging to confirm, as inner experiences are inherently subjective and can vary greatly among individuals. The diversity in cognitive processing and the subjective nature of consciousness make it unlikely that a person would have no inner experience whatsoever. Instead, their inner world might be organized and experienced in a way that is fundamentally different from the more commonly discussed verbal or visual thought processes.
